## EDUCATION

- **COLUMBIA UNIVERSITY** New York City, U.S.  
MAJOR : MASTER CANDIDATE IN BIOSTATISTICS(4.07/4.3) 09/2020-PRESENT
- **SHANDONG UNIVERSITY** Jinan, China  
MAJOR : BACHELOR OF PUBLIC HEALTH(4.32/5) 09/2014-06/2019

## RESEARCH EXPERIENCE

- **Department of Biostatistics, Columbia University** New York  
*Research Assistant, Advisor: Prof. Shuang Wang* 04/2021-PRESENT  
**Methodology Developing on Multi-omic Clustering**
  - Literature review on data integration methods and multi-omics clustering
  - Design simulation to test and compare existing multi-omics clustering method, ie. Similarity Network Fusion(SNF), and co-training based Multi-view Clustering Without Parameter(COMIC), Partition-level Multi-view Subspace Clustering(PSMC), Diversity-Induce Multiview Clustering(DiMSC) and etc.;
  - Experiment above-mentioned methods with alternative method such as denoising learned similarity matrix with t-step self random walk, using different consensus, complementary regulation on iteratively updating to develop a method that can identify true number of clusters and clustering result under scenario which different view provide information only to find partial subtypes.
- **Department of Biostatistics, Columbia University** New York  
*Research Assistant, Advisor: Prof. Ying Wei, Prof. Yifei Sun* 09/2021-PRESENT  
**Predicting Patient Adherence with Multivariate Random Forest**
  - Propose using an interval of compliance as estimator to capture the within interval pattern for predicting medication adherence for an incomplete medication adherence history data with their hospitalization record as predictors;
  - Design and code a weighted random forest for multiple response algorithm independently from framework to splitting criteria;
  - Design simulation study to test algorithm performance and analysis on the data, we found that using inverse predicted missing observation probability(IPW) to adjust for missing data improves the prediction performance of our multivariate random forest under Missing At Random(MAR) in simulation;
  - Model missing pattern of the response variables under MAR assumption considering the missingness was mostly due to researchers' decisions. And boost compliance prediction model's performance with the IPW and see variables importance of baseline hospitalization vital scores and mental status scores;
- **Department of Social Health, Shandong University** Jinan, China  
*Research Assistant, Advisor: Prof. Jiajia Li* 01/2019-06/2019  
**Case Study: eHealth Resource Allocation Inequality in Shandong Province**
  - collect data on the use of electronic health (eHealth) resources from an online healthcare community involving more than 441,000 doctors and 31 provinces in China, by using Python packages, such as lxml and pandas.
  - Cleaned and visualize data with R-ggplot; utilized techniques such as visualizing the spatial distribution and density of highly-ranked hospitals and experienced professionals on map.
  - Performed statistical analysis on eHealth online-to-offline spillover effects using the Spatial Durbin Panel Model to reduce autocorrelation between regions;

- Identified the spillover effects of eHealth services on health care inequity between regions; provided suggestions and strategies to address healthcare disparities using widely accessible eHealth resources.
- Drafted and submitted a report to the 2020 Health Technology Assessment International Conference and 2019 Global Young Scholars Forum on Health Management

- **Department of Social Health, Shandong University**

Jinan, China

*Research Assistant, Advisor: Prof. Jiajia Li*

10/2018-06/2019

**Project: Effect of Insurance Plans on Catastrophic Healthcare Expenditures**

- Led a research group to conduct a study on the effects of different insurance types on catastrophic healthcare expenditures.
- Conducted data cleansing using R package – tidyverse; processed information from 44,417 observational sessions and identified 3,300 missing units of data and outliers.
- Collected geographical locations based on provided address with Google Maps API and matched location with the insurance coverage provided by each plan as an instrumental variable for addressing the endogeneity introduced by insurance selection bias.
- Performed two-stage least square regression analysis to build a model with instrumental variables using R package -AER; concluded that China’s new health insurance program has decreased the odds of catastrophic health expenditures but has failed to control total health expenditures.
- Provided quantitative evidence to forecast the financial expenditures of different healthcare insurance plans and to provide a reference for other researchers in the selection of instrumental variables.

## PUBLICATION

Li,J., Li,S., Cao,W., Wang,Z., **Liang,Z.**, Fu, W., and Zhao, J. (2021). Appraisal of china’s response to the outbreak of covid-19 in comparison with sars. *Frontiers in Public Health*, 9:830

## WORK EXPERIENCE

- Mailman School of Public Health-Columbia University

New York

*Teaching Assistant* **High-Dimensional EHR data Bootcamp**

09/2021-PRESENT

- Course planning, material preparation and teaching lab session for **MIMIC Data Preparation and Sparse Coding and Instrumental Variable Analysis Method for High-Dimensional EHR data Bootcamp**

- Mailman School of Public Health-Columbia University

New York

*Teaching Assistant* **Data Science I P8105**

06/2021-09/2021

- Course planning, holding office hour and grading for **Data Science I**

- National Health Development and Research Center of China Health Committee

Beijing, China

*INTERN*

06/2019-06/2020

- Provide advice on sampling method, model selection, and result interpretation as well as data visualization.
- Estimate national health expenditure in 2019, and analyze the distribution of different demographic characteristics, such as age and gender, to optimize healthcare resource allocation.
- Build ICD-10 auto-coding and data format auto-standardizing algorithm with Python for annual health accounting, improving working efficiency, data accuracy, and integrity.
- Conduct a literature review on data mining methods for detecting healthcare fraud; provide data support for a pilot feasibility project.
- Participated in data visualization of healthcare metrics and healthcare access for *Development Report On Health Reform In China(2020)*(ISBN:9787520164412).
- Assisted with study design and data processing in Python for two confidential projects

## SKILLS

- Computing: Python, R, Linux command line
